Also claimed are: (1) a diagnostic test kit comprising: (a) reagents which can be used to detect levels of antibodies to EBV, indicators of BV initiation of cells, or levels of EBV DNA or protein in a patient; (b) control samples from individuals not at risk of developing an autoimmune disease; and (c) a device for determining the differences in levels of a patient and control samples to distinguish individuals at higher risk of developing an autoimmune disease; and (2) a method for screening for genetic markers or risk factors for development of autoimmune disease; and (2) a method for screening for genetic markers or risk factors for development of autoimmune disorders induced by infection with EBV comprising comparing the responses of different scrains of the same species of an animal vaccinated with EBV or a component to induce an autoimmune response in at least one of the strains and comparing the differences in the genetics of the different strains condentify potential genetic markers or risk factors. The methods can be used for the prevention, diagnosis, and treatment of autoimmune diseases having EBV as an etiological agent. The autoimmune diseases may be e.g. systemic lupus erythematosus, Sjogen's syndrome, rheumatodid arthritis, ivenile onset diabetes mellitus, Wegener's granulomatosis, etc. The present are used to detect antibodies to this peptide in a specifically claimed diagnostic test. (Updated on 27-AUG-2003 to correct OS field.)

```
The present invention relates to a vaccine for alleviating or preventing autoimmune disorders inflated by infection with Epstein-Barr virus (EBV), comprising EBV or its component in a carrier. The vaccine is useful for preventing or alleviating autoimmune disorders induced by EBV e.g. preventing or alleviating autoimmune disorders induced by EBV e.g. systemic lupus erythematosus (ELE). New vaccine preventing or alleviating autoimmune disorders induced by the Epstein-Barr virus, such as diabetes mellitus, rheumatoid arthritis, multiple sclerosis, systemic lupus erythematosus, atopic dermatitis and Claim 8; Page 28; 41pp; English. psoriasis.

The invention relates to a vaccine for alleviating or preventing autoimmune disorders induced by infection with Epstein-Barr virus, comprising an Epstein-Barr virus or a component in a carrier for administration to alleviate or prevent the autoimmune disorders. The methods and compositions of the present invention are useful for diagnosing, preventing, treating and/or alleviating autoimmune disorders, such as diabetes mellitus, rheumatoid arthritis, juvenile rheumatoid arthritis, osteoarthritis, multiple sclerosis, autoimmune thyroidtis, atopic dermatitis, ezematous dermatitis, autoimmune thyroidtis, atopic dermatitis, ecematous dermatitis, conjunctivitis, statopic dermatitis, ecematous dermatitis, allergic asthma, cutaneous lupus erythematosus, scleroderma, vaginitis, allergic asthma, cutaneous lupus erythematosus, scleroderma, vaginitis, allergic asthma, cutaneous lupus erythematosus, scleroderma, vaginitis, condosumleprosum, autoimmune uveitis, allergic encephalomyelitis, acute necortising haemorrhagic encephalopathy, idiopathic bilateral progressive concentral hearing loss, aplastic anemaia, pure red call anaemia, chronic active hepatitis, Stevens-Johnson syndrome, idiopathic sprue, chronic active hepatitis, Stevens-Johnson syndrome, idiopathic sprue, chronic active hepatitis, Stevens-Johnson syndrome, idiopathic sprue, chronic active hepatitial lung fibrosis, primary biliary cirrhosis, uveitis posterior, interstitial lung fibrosis, graft-versus-host disease, and allergy. The present sequence represents an Epstein-Barr virus cutaler antigen peptide used in the method of the invention. (Updated on cutalear antigen peptide used in the method of the invention. (Updated on cutalear antigen peptide used in the method of the invention. (Updated on cutalear antigen peptide method of the invention.)

                                                                                                                                                                                                                                                                                                                                                                                  ó
                                                                                                                                                                                                                                                          The present invention relates to an arginine containing peptide has cholecystokinin secretion promoting activity. The method has anorectic effect is useful for preventing obesity or hyperphagia and has efficient cholecystokinin secretion promotion activity. The method is cheaper, and safe in preventing obesity or hyperphagia. The present sequence represents an arginine containing peptide of the invention.
                                                                                                                                                                                                               New arginine containing peptide has cholecystokinin secretion promoting activity, useful in foodstuffs for preventing obesity or hyperphagia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      vaccine; autoimmune disorder; Epstein-Barr virus; EBV; systemic lupus erythematosus; Sjogren's syndrome; rheumatoid arthritis; juvenile onset diabetes mellitus; Wegener's granulomatosis; inflammatory bowel disease; Epstein-Barr nuclear antigen 1.

The invention relates to a new vaccine for alleviating or preventing autoimmune disorders induced by infection with Epstein-Barr virus (EBV). The vaccine comprises EBV or its component in a pharmaceutical carrier for administration of the virus or viral component in an amount and mode of administration to alleviate or prevent the autoimmune disorders. The composition and methods are useful for diagnosing, preventing or treating autoimmune diseases caused by Epstein-Barr virus, such as systemic lupus erythematosus, Sjogren's syndrome, rheumatoid arthritis, juvenile onset diabetes mellitus, Wegener's granulomatosis or inflammatory bowel disease. These may also be used in screening of therapeutics for prevention or alleviation of autoimmune disorders induced by EBV infection. The present sequence represents an Epstein-Barr virus nuclear antigen 1, antigenic peptide used to make the vaccine of the invention.
                                                                                                                                                                                                                                New vaccine for alleviating or preventing autoimmune disorders induced by Epstein-Barr virus (EBV) infection, e.g. systemic lupus erythematosus, comprises EBV or its component in a pharmaceutical carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of Epstein-Barr virus or component(s) - for developing product(s) which can be used for preventing, diagnosing, treating or determining risk of developing autoimmune disease.

The invention relates to a vaccine for alleviating or preventing
autoimmune disorders induced by infection with Epstein-Barr virus (EBV).

It comprises EBV or a component in a carrier for administration of the
virus or viral component to alleviate or prevent the autoimmune disorder.

Also claimed are: (1) a diagnostic test kit comprising: (a) reagents
which can be used to detect levels of antibodies to EBV, indicators of
EBV infection of cells, or levels of EBV DNA or protein in a patient; (b)
CC control samples from individuals not at risk of developing an autoimmune
CC patient and control samples to distinguish individuals at higher risk of
developing an autoimmune disease from those at lower risk of developing
CC an autoimmune disease, and (2) a method for screening for genetic markers
CC or risk factors for development of autoimmune disorders induced by
CC infection with EBV comprising opmaring the responses of different
C strains of the same species of an animal vaccinated with EBV or a
CC component to induce an autoimmune response in at least one of the strains
CC independent strains of the difference such strains
CC independent strains to induce an autoimmune response in at least one of the strains
CC independent of an autoimmune response in the quentic such strains
CC independent strains to induce an autoimmune response in the different strains identify potential genetic markers or risk factors. The methods can be used for the prevention, diagnosis, and treatment of autoimmune diseases having EBV as an etiological agent. The autoimmune diseases may be e.g. systemic lupus erythematosus, Siggren's syndrome, rheumatoid arthritis, juvenile onset diabetes mellitus, Wegener's granulomatosis, etc. The present sequence represents a peptide derived from Epstein-Barr virus. Reagents are used to detect antibodies to this peptide in a specifically claimed diagnostic test. (Updated on 27-AUG-2003 to correct OS field.) Novel vaccine for alleviating or preventing autoimmune disorders induced Epstein-Barr virus (EBV) infection e.g. systemic lupus erythematosus, juvenile onset diabetes mellitus, comprises EBV virus or its component.

Claim 4; Page 60; 114pp; English.

The present invention relates to a vaccine for alleviating or preventing and disorders induced by infection with Epstein-Barr vines (EBW), comprising EBW or its component in a carrier. The vaccine is useful for preventing or alleviating autoimmume disorders induced by BEW, e.g. systemic Luques erythematosus (EBL), Sjogear's syndrome, juvenite onset diabetes mellitus, rheumatoid arthritis, Wegener's granulomatosis, inflammatory bowed lasease, polymyositis, dernatomyositis, multiple endocrine failure, Schmidt's syndrome, autoimmume uveitis, Addison's diabetes and renalitie, primary billary cirrhosis, of graves' disease, thyroiditis, primary billary cirrhosis, of graves' disease, thyroiditis, manitiple schools, submittiple submittiple schools, submittiple submittiple, submittiple submittiple, submittiple submittiple, submittiple submittiple, submittiple

Cleaving recombinantly expressed proteins bound to intein-chitin binding domains, and ligating to peptides with N-terminal cysteines having unoxidized sulfhydryl side chain, useful for producing semi-synthetic proteins.

Severinov K;

Example 3; Page 14; 35pp; English

The invention relates to cleaving a recombinantly expressed protein bound to an intein-chitin binding domain (CBD) and ligating the cleaved protein to a peptide with an N-terminal cysteine having an unoxidised sulphhydryl side chain, by contacting the bound protein with a peptide in the presence of conjugated thiol to effect cleavage of the protein from the undergoes intramolecular rearrangement to form amide bond linking the protein to the peptide. The method is used for linking recombinantly cysteine having an unoxidised sulphhydryl side chain. The method is cysteine having an unoxidised sulphhydryl side chain. The method is useful for producing a protein. antibody or antigen and for preparing semi-synthetic proteins of any size. The protein-chip which is useful for generating recombinant proteins of any size. The protein-chip is also useful for identifying presence of protein in a sample. The method is also useful for recombinant proteins partially labeled with a detectable marker, in nuclear magnetic resonance (NMR) spectroscopy, where proteins used in the method are segmentally labeled, and for generating semi-synthetic resonance two recombinant, folded proteins to be ligated together. The present sequence represents a synthetic pligated terminal cysteine which was ligated to an intein-CBD-immobilised human abelson protein tyrosine kinase SH3 domain

ö ö Ulmethylarginine; mass spectroscopy; monomethylamine; dimethylamine; DMA; MMA; dimethylcarbodiimide; DMC. The method involves (1) obtaining a neutral loss spectrum of a peptide containing a dimethylarginine by mass spectroscopy and (1i) determining if the neutral loss spectrom shows one or both of neutral loss of monomethylamine (MMA), dimethylamide (DMC) and/or neutral loss of dimethylamine (DMA). The neutral loss of MMA and DMC indicates the presence of a symmetrically dimethylated arginine residue and the neural loss of (DMA) indicates the presence asymmetrically dimethylated arginine residue. Sequences ABB82931-939 represent synthetic peptides having symmetrically and asymmetrically dimethylated arginine residues used in an experiment to determine if mass spectrometry could be used distinguish the peptides that have symmetrically versus asymmetrically dimethylated arginine residues The invention relates to identifying the structure of dimethylarginine Identifying structure of dimethyl arginine for proteomics business by obtaining neutral loss spectra of peptide containing dimethylarginine residues by mass spectrometry. The invention relates to a new vaccine for alleviating or preventing autoimmune disorders induced by infection with Epstein-Barr virus (EBV). The vaccine comprises EBV or its component in a pharmacutical carrier for administration of the virus or viral component in an amount and mode of administration to alleviate or prevent the autoimmune disorders. The composition and methods are useful for dispnosing, preventing or treating autoimmune diseases caused by Epstein-Barr virus, such as systemic lupus erythematosus, Siogren's syndrome, rheumatoid arthritis, juvenile onset dispetes mellitus, Wegener's granulomatosis or inflammatory bowel dispetes mellitus, and any also be used in screening of therapeutics for prevention or alleviation of autoimmune disorders induced by EBV infection. The present sequence represents an Epstein-Barr virus nuclear antigen 1, antigenic peptide used to make the vaccine of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ά
                                                                                                                                         vaccine; autoimmune disorder; Epstein-Barr virus; EBV; systemic lupus erythematosus; Sjogren's syndrome; rheumatoid arthritis; juvenile onset diabetes mellitus; Wegener's granulomatosis; inflammatory bowel disease; Epstein-Barr nuclear antigen 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        preventing autoimmune disorders induced

The invention relates to a new vaccine for alleviating or preventing autoimmune disorders induced by infection with Epstein-Barr virus (EBV). The vaccine comprises EBV or its component in a pharmaceutical carrier for administration of the virus or viral component in an amount and mode of administration to alleviate or prevent the autoimmune disorders. The composation and methods are useful for diagnosing, preventing or treating autoimmune diseases caused by Epstein-Barr virus, such as systemic lupus erythematosus, Sjogren's syndrome, rheumatoid arthritis, juvenile onset diabetes mellitus, Wegener's granulomatosis or inflammatory bowel disease. These may also be used in screening of therapeutics for prevention or alleviation of autoimmune disorders induced by EBV infection. The present sequence represents an Epstein-Barr virus nuclear antigen 1, antigenic peptide used to make the vaccine of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                             New vaccine for alleviating or preventing autoimmune disorders induced by Epstein-Barr virus (EBV) infection, e.g. systemic lupus erythematosus, comprises EBV or its component in a pharmaceutical carrier.
                vaccine; autoimmune disorder; Epstein-Barr virus; EBV; systemic lupus erythematosus; Sjogren's ayndrome; rhbumatoid arthritis; juvenile onset diabetes mellitus; Wegener's granulomatosis; inflammatory bowel disease; Epstein-Barr nuclear antigen 1.

The specification describes a new spacer for increasing efficiency of synthesis of peptides or related compounds. The method is particularly used for synthesis of strongly hydrophobic peptides or of peptide nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Delivering a polypeptide to a cell for e.g. treating a disease, comprises contacting the cell with the polypeptide, nucleic acid, fluorescent molecule, and/or a cellular delivery molecule, and treating to dissociate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antibacterial; virucide; cytostatic; antitubercular; tuberculostatic; antileprotic; antiparasitic; fungicide; antisense therapy; gene therapy; electromagnetic radiation; infectious disease; bacterial disease; tuberculosis; leprosy; viral disease; fungal disease; parasitic disease; cancer; siRNA; gene silencing; gene expression; small interfering RNA.
                                                                                                                                                              New spacer for increasing efficiency of solid phase peptide synthesis - useful for, e.g. synthesis of strongly hydrophobic peptides and peptide nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to a method of delivering (M1) a polypeptide to a cell, by contacting the cell with, in any order or combination, the polypeptide, nucleic acid, fluorescent molecule, cellular delivery molecule and/or a transfection agent, and treating the cell with a treatment that results in the dissociation of the polypeptide from the nucleic acid, the fluorescent molecule, or/and the cellular delivery molecule. (M1) is useful for teating a polypeptide to a cell. The molecules are useful for treating an individual suffering in need where the treatment further involves exposing an individual in need where the treatment further involves exposing an individual to electromagnetic radiation. The diseases treated by the molecules include infectious diseases, fungal diseases, the diseases, and cancer. This sequence represents a peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sp35; CNS-Gen; neuroprotective; anticonvulsant; nootropic; antiparkinsonian; antidiabetic; cerebroprotective; vasotropic; gene therapy; CNS disease; neurodegenerative disease; multiple sclerosis; Amyotrophic lateral sclerosis; ALS; Huntington's disease; Alsenser's disease; Alzheimer's disease; Parkinson's disease; diabetic neuropathy; stroke;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ç
whilst the disclosed sequences may prove useful for gene therapy. The invention may be useful for developing a treatment for a CNS or neurodegenerative disease, disorder or injury, for example multiple sclerosis, Amyotrophic lateral sclerosis (ALS), Huntington's disease, Alzheimer's disease, Parkinson's disease, diabetic neuropathy, stroke, traumatic brain injuries, specifically, a spinal cord injury or an optic nerve injury. The present sequence is that of a peptide derived from the human Sp35 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A set of peptide ligands consisting of specific complementary peptides proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug

The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 4; Page 527; 646pp; English.

                                                                                                                                                                                                                                                                                              A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs.
                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

```
A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs.
                                                                                                                                                                                                                                                                The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A set of peptide ligands consisting of specific complementary peptides proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; complementary peptide; ligand; drug discovery; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification

```
The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their regervant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug

The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification
        A set of peptide ligands consisting of specific complementary peptides proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug

                                                                                                                                    A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug
                                                                                                                                                                                                      The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs.

The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A set of peptide ligands consisting of specific complementary peptides proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; complementary peptide; ligand; drug discovery; drug design

                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                               A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs.
                                                                                                                                                                                                                                                                                                   The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used a reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs.
A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs.
                                                                                                                                                                                                                                                                                          The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; complementary peptide; ligand; drug discovery; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification
                                                                                                                                                                                                                                                                                                                            A set of peptide ligands consisting of specific complementary peptides upoteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided

The invention relates to novel polypeptides or their derivatives. A peptide of the invention has antibacterial activity. The polypeptides or their derivatives are particularly biodegradable functional polymers, e.g. with antibacterial activity and metal-binding capability which are useful in drugs, agrochemicals, cosmetics and environment-remediation agents. The present sequence represents a peptide of the invention.
                        Microbe-originated polyamino-acids or their derivatives e.g.
biodegradable functional polymers with antibacterial activity and metal-
binding capability, useful in drugs, agrochemicals and cosmetics.

Tissue repair adhesive comprising polymer of structural protein repeat units - contg. hetero-atom functional gps. reactive with crosslinking agent, combines biocompatibility and high bonding strength. WPI; 1996-505895/50

Stedronsky ER, Cappello J;

Example 4; Page 55; 103pp; English.

This peptide is a repeat sequence used as a polyfunctional agent in crosslinking of new protein polymers based on silk fibroin and elastin repeat units. The synthetic peptide has been used in a composition with one of the new polymers and potassium carbonate, isocyanate and amine reagents to form tissue adhesives or sealants. In a rat skin assay, the synthetic peptide gives intermediate results when compared with other may be used to seal fincluding lysine and arginine). The new polymers may be used to seal defects in vessel walls, e.g. artery, vein, capillary, lung, dura or colon, to increase tissue mass, or to produce biocompatible films for in vivo use. The sealants have the biocompatibility of fibrin glues, but set more quickly, and have greater strength. They are readily prespared by recombinant methods, are easy to administer, and are gradually resorbed

```

This sequence represents a methylate SmD homologous peptide of the invention. The peptides comprise an XG dimer (X = NG-mono- or NG-NG-dimethylated arginine), which react with antibodies. The antibodies, which react with the peptides, are present in sera of patients with systemic lupus erythematosus; infectious, recurrent or chronic monouncleosis or infection; or cancers associated with Epstein-Barr virus, including Burkitt's lymphoma or nasopharyngeal carcinoma. The peptides, antibodies and immunotoxin molecules form pharmaceutical compositions for diagnosing and treating autoimmune diseases (especially systemic lupus erythematosus, discoid lupus erythematosus, scleroderma, dermatomyositis, rheumatoid arthritis, Sjogran's syndrome) or diseases associated with the Epstein-Barr virus (especially Burkitt's lymphoma, nasopharyngeal carcinoma, or infectious, recurrent or chronic compositions and peptides or compositions can treat the auto-immune complexes by increasing the size of antigen-immune complexes, which improves the clearance of the formed immune complexes. Methylation of the peptides permits high reactivity with antibodies present in patient sera with systemic lupus erythematosus

                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel crosslinked protein composition (A) in which, before crosslinking, the protein (I) is new and comprises at least two but. 8 of repeating units GAGAGS (1) and GVGVP (2), and in at least two repeating units an amino acid (aa) is substituted by Lys or Arg to provide a Lys/Arg equivalent weight of 1-20 kD. (I) contains at least two as having a functional group reactive with at least one of aldehyde, iso(thio)cyanate and activated carboxy. (I) have similar biocompatibilty to fibrin glues, but set more quickly and give a bond with greater shear strength. They are made from readily available natural sources, are easy
                                                                                                                                                                                                                                                                                                                                                 Crosslinked protein composition, useful as tissue adhesive or sealant, comprises peptide repeating units that contain functional groups reactive with crosslinker.

The present invention describes a method for identifying a bioactive peptide (BP) involving transforming a cell with an expression vector comprising a tightly regulatable control region operably linked to a mucleic acid sequence encoding a peptide (P), growing the transformed cell under conditions that repress expression of (P) and then inducing its expression which, if is inhibitory to host cell growth, is indicative of BP expression. An antimicrobial peptide from the present invention, which is stabilised, is used for treatable expression. An antimicrobial peptide from the present invention, which is stabilised, is used for treatable with a peptide drug. The stabilised peptides are also used for inhibiting the growth of a microbe. The new antibacterial peptides are consetul to treat various pathogenic bacteria such as Staphylococci, Streptococci and Enterococci which are the primary causes of nosocomial infections. Novel inhibitor peptides identified by the method can be medical treatments and therapies directed against microbial infection. Also, these novel inhibitor peptides can be used, in turn, to identify can also be used to elucidate potential new drug targets. The inhibitor peptide target which is inactivated is identified using reverse genetics by isolating mutants are then mapped in order to precisely determine the protein target that is inhibited. AAASSO3106 and AAYSO3999 care sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

```
The present invention relates to protein polymers having repetitive units from naturally occurring structural proteins such as fibroin, elastin, collagen and keratin. The polymers comprise a functional group which can be chemically crosslinked with appropriate crosslinkers. The protein polymer is produced by recombinant DNA technology. The protein polymer is produced by recombinant DNA technology. The protein polymer is useful for sealing or filling a defect in viable tissue, particularly for augmenting tissue mass. The protein polymer is useful in a variety of applications related to their physical, chemical and biological applications related to their physical, chemical and biological properties, and/or to bond together separated tissue to provide a stable, flexible or resorbable bond. The protein is particularly useful as a sealant or adhesive, in wound healing or as a burn dressing e.g. to stop or staunch the flow of fluid (e.g. blood) through ruptured vessels (e.g. arteries or veins). The present sequence represents a synthetic peptide used to evaluate the properties of protein polymers in the examples of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Crosslinked protein composition used as sealant or adhesive for sealing or filling defect in viable tissue, as burn dressing, or in wound healing e.g. to staunch flow of fluid e.g. blood, through ruptured vessels.

                                                                                                                                                                                                                                                                           Crosslinked protein composition useful as sealing a defect in tissue, the protein prior to crosslinking comprises repetitive units of 3-15 amino acids of natural structural protein.
                                                                                                                                                                                                                                                                                                                                                     The present invention relates to crosslinked protein composition. The invention is useful as sealants or depots to provide for relatively uniform release of a physiologically active product e.g., drug and for the formation of articles of manufacture such as gels, films, threads, coatings. The present sequence is synthetic peptide SEOK used to prepare
         Crosslinked protein; sealant; depot; drug; therapy; gel; film; thread; coating; vulnerary.

                                                                                                                                 methods of identification thereof. Specifically, it provides an methods of identification thereof. Specifically, it provides an intracellular screening method for identifying bioactive peptides that possess a stabilising group coupled to one, or both ends of the peptide, buch that it lacks the capacity to form an intramolecular disulphide bond. The present invention describes a transformed host call that on induction can express the peptide, which as an inhibitory peptide can completely or partially inhibit host cell growth (the phenotypic change indicative of peptide bioactivity). As such, these bioactive peptides are useful for the development of new antibacterial, antiviral or anticancer agents, or as diagnostic tools in both basic and applied research. Accordingly, they exhibit antibacterial, virucidal and cytostatic activities and can be used for gene therapy purposes. This peptide sequence is a stabilised bioactive peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antidiabetic; ophthalmological; nephropathic; antiarthritic; antiinflammatory; cytostatic; gynaecological; antipsoriatic; dermatological; antiviral; vasotropic; antiarteriosclerotic; antianginal; cardiant; vulnerary; antiulcer; high mobility group protein; human.
                                             New stabilized bioactive peptides such as insulin, glucagon, calcitonin or somatostatin, useful as therapeutic agents (e.g. as antibacterial, antiviral or anticancer agents) or as diagnostic tools in research.

The present invention relates to the use, especially in vitro, of nucleic acids encoding high mobility group proteins for the following processes: angiogenesis (including in a wound bed), neovascularization, transmyocardial revascularization, neovascularization, transmyocardial revascularization, wound healing, epithelialization and transmyocardial revascularization. Wound healing, epithelialization and healing in cases of tooth or bone implants. The sequences and their encoded protein are useful for treating a very wide range of diseases: (proliferative) diabetic retinopathy, diabetic nephropathy, macular degeneration, arthritis, endometriosis, histiocytosis, psoriasis, rosacea, eruptive or cavernous haemangioma, tumours (especially melanoma, Kaposi sarcoma and basal cell carcinoma), haemorrhoids, arteriosclerosis, angina pectoris, ischaemia, infarction, infartility, wounds (including diabetic and other ulcers), also diseases associated with DNA damage, especially xeroderma pigmentosum, 'leather skin', skin cancers and againg (including where associated with sunburn) and cardiac infarct, including cosmetic treatment, especially as a sun-protection composition. Compounds identified as modulators of the specialed processes can also be used therapeutically. The present sequence is a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antidiabetic; ophthalmological; nephropathic; antiarthritic; estilinflammatory; cytostatic; gynaecological; antipsoriatic; antiand dermatological; antiviral; vasotropic; antierteriosclerotic; antianginal; cardiant; vulnerary; antiulcer; high mobility group protein; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Use of nucleic acids encoding basic DNA-binding proteins, and their translation or transcription products, for treating diseases associated with e.g. angiogenesis, neovascularization or wound healing, also for drug screening.
e.g. angiogenesis, neovascularization or wound healing, also for

The present invention relates to the use, especially in vitro, of nucleic acids encoding high mobility group proteins for the following processes: angiogenesis (including in a wound bed), neovascularization, transmyocardial revascularization, wound healing, epithelialization and the language protein are useful for treating a very wide range of diseases: (proliferative) diabetic retainopathy, diabetic nephropathy, macular encoded protein are useful for treating a very wide range of diseases: (proliferative) diabetic retinopathy, diabetic nephropathy, macular degeneration, arthritis, endometriosis, histiocytosis, psoriasis, rosacea, eruptive or cavernous haemangioma, tumours (especially melanoma, Kaposi sarcoma and basal cell carcinoma), haemorrhoids, arteriosclerosis, angina pectoris, ischaemia, infarction, infartility, wounds (including diabetic and other ulcers), also diseases associated with DNA damage, especially xeroderma pigmentosum, 'leather skin', skin cancers and againg (including where associated with sumburn) and cardiac infarct, including cosmetic treatment, especially as a sun-protection composition. Compounds identified as modularors of the specified processes can also be used therapeutically. The present sequence is a polypeptide of the invention.

Use of Epstein-Barr virus or component(s) - for developing product(s) which can be used for preventing, diagnosing, treating or determining risk of developing autoimmune disease.

Claim 8; Page 64; 81pp; English.

The invention relates to a vaccine for alleviating or preventing autoimmune disorders induced by infection with Epstein-Barr virus (EBV). It comprises EBV or a component in a carrier for administration of the virus or viral component to alleviate or prevent the autoimmune disorder. Also claimed are: (1) a diagnostic test kit comprising: (a) reagents which can be used to detect levels of antibodies to EBV, indicators of

Fri

```
control samples from individuals not at risk of developing an autoimmune disease, and (0) a device for determining the differences in levels of a disease, and (0) a device for determining the differences in levels of a patient and control samples to distinguish individuals at higher risk of developing an autoimmune disease from those at lower risk of developing or a nautoimmune disease; and (2) a method for screening for genetic markers or risk factors for development of autoimmune disorders induced by infection with EBV comprising comparing the responses of different strains of the same species of an animal vaccinated with EBV or a component to induce an autoimmune response in at least one of the strains and comparing the differences in the genetics of the different strains of identify potential genetic markers or risk factors. The methods can be used for the prevention, diagnosis, and treatment of autoimmune diseases having EBV as an etiological agent. The autoimmune diseases may be e.g. systemic lupus erythematosus, 30geren's syradrome, rheumatoxid arthritis, juvenile onset diabetes mellitus, Wegener's granulomatosis, etc. The present sequence represents a peptide derived from Epstein-Barr virus. Reagents are used to detect antibodies to this peptide in a specifically claimed diagnostic test. (Updated on 27-AUG-2003 to correct OS field.)

New methylated SmD homologous peptides - useful for diagnosing and treating auto-immune diseases, and cancers associated with the Epstein-

Claim 2; Page 42; 56pp; English.

Barr virus.

This sequence represents a methylate SmD homologous peptide of the

dimethylated arginine), which react with antibodies. The antibodies, which react with the peptides, are present in sera of patients with systemic lugus erythematosus; infectious, recurrent or chronic monouncleosis or infection; or cancers associated with Epstein-Barr virus, including Burkitt's lymphoma or nasopharyngeal carcinoma. The peptides, antibodies and immunotoxin molecules form pharmaceutical compositions for diagnosing and treating autoimmune diseases (especially systemic lupus erythematosus, discoid lugus erythematosus, scleroderma, dermatomyositis, rheumatoid arthritis, Sjogren's syndrome) or diseases associated with the Epstein-Barr virus (especially Burkitt's lymphoma, nasopharyngeal carcinoma, or infectious, recurrent or chronic monoucleosis). The peptides or compositions can treat the auto-immune disease by increasing the size of antigen-immune complexes, which improves the clearance of the formed immune complexes, which peptides permits high reactivity with antibodies present in patient sera with systemic lupus erythematosus Invention. The peptides comprise an XG dimer (X = NG-mono- or NG-NG-Sequence 12 AA; Query Match \$

Novel vaccine for alleviating or preventing autoimmune disorders induced Epstein-Barr virus (EBV) infection e.g. systemic lupus erythematosus, juvenile onset diabetes mellitus, comprises EBV virus or its component.

Claim 8; Page 61; 114pp; English.

The present invention relates to a vaccine for alleviating or preventing cautoimmune disorders induced by infection with Epstein-Barr virus (EBV), comprising EBV or its component in a carrier. The vaccine is useful for preventing or alleviating autoimmune disorders induced by EBV, e.g. systemic lupus erythematous (SLE). Sjogram is syndrome, juverile onset diabetes mellitus, rheumatoid arthritis, Wegener's granulomatosis, inflammatory bowel disease, polymyositis, dermatomyositis, multiple candocrine failure, Schmidt's syndrome, autoimmune tubris, Addison's disease, adenalitis, primary biliary cirrhosis, Graves' disease, principle sclerosis, subacute cutaneous lupus erythematosus, pernicious and haemolytic amemia, lupoid hepatitis, demyelinating disease, multiple sclerosis, subacute cutaneous lupus erythematosus, pernicious and haemolytic amemia, lupoid hepatitis, damyelinating disease, pernicidism, Dressler's syndrome, autoimmune pemphigus vulgaris, pemphigoid, dermatitis herpetiformis, alopecia areata, putoimmune cystitis, pemphigoid, dermatitis herpetiformis, alopecia areata, celerosis, CREST syndrome (Calcinosis, Raymaud so cesophageal dysmotility, and telangiectasis), adult onset diabetes mallitus (Type II diabetes), male or female autoimmune infertility, ankylosing spondylitis, celerosis, atopic dermatitis, atopic thinitis, globetes mallitus (Type II diabetes), male or female autoimmune infertility, ankylosing spondylitis, columarionephritis, atopic dermatitis, atopic thinitis, glomeral adoses, astrodiosis, thematic fever, asthma, recurrent abortion, anti-bhospholipid syndrome, farmer's lung alsease, correphalomyelitis, toxic necrodermal lysis, alopecia, Alport's syndrome, allergic alveolitis, fibrosing alveolitis, interstitial and shore, and communicative bepatitis, bard-farming and eretifical paredicis, spanter of attigute syndrome (triaditis, masal polyps, eosinophilia) and sender's syndrome, faciditis with eosinophilia purpura, non-Hodekin's landers, temporal securical temporal encophance of catidatis, non-Hodgkin's lymphoma, cardiomyopathy, Henoch-Schönlein purpura, post vaccination syndromes, renal cell carcinoma, Baton-Lambert syndrome or relapsing polychondritis. The present sequence is a EBW peptide used in the invention. (Updated on 11-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to identifying the structure of dimethylarginine. The method involves (i) obtaining a neutral loss spectrum of a peptide containing a dimethylarginine by mass spectroscopy and (ii) determining if the neutral loss spectrum shows one or both of neutral loss of monomethylamine (MMA), dimethylarabodinimide (DMC) and/or neutral loss of dimethylamine (MMA). The neutral loss of MMA and DMC indicates the presence of a symmetrically dimethylated arguinine residue and the neural loss of (DMA) indicates the presence of asymmetrically dimethylated arguine residue. Sequences ABB82931-939 represent synthetic peptides having symmetrically and asymmetrically dimethylated arguine residues used in an experiment to determine if mass spectrometry could be used distinguish the peptides that have symmetrically versus asymmetrically
                                                                                                                                                                                                                                                                    Identifying structure of dimethyl arginine for proteomics business by obtaining neutral loss spectra of peptide containing dimethylarginine residues by mass spectrometry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying structure of dimethyl arginine for proteomics business by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Arginie-dimethylated synthetic peptide seq Id No. 2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a new vaccine for alleviating or preventing autoimmune disorders induced by infection with Epstein-Barr virus (EBV). The vaccine comprises EBV or its component in a pharmaceutical carrier for administration of the virus or viral component in an amount and mode of administration to alleviate or prevent the autoimmune disorders. The composition and methods are useful for dispnosing, preventing or treating autoimmune diseases caused by Epstein-Barr virus, such as systemic lupus erythematosus, Sjogren's syndrome, rheumatoid arthritis, juvenile onset diabetes mellitus, Regener's granulomatosis or inflammatory bowel disease. These may also be used in screening of therapeutics for prevention or alleviation of autoimmune disorders induced by EBV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New vaccine for alleviating or preventing autoimmune disorders induced by Epstein-Barr virus (EBV) infection, e.g. systemic lupus erythematosus, comprises EBV or its component in a pharmaceutical carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               unmetnylarginine; mass spectroscopy; monomethylamine; dimethylamine; DMA;

Composition, useful for increasing the transport of a biologically active compound across a biological membrane, comprises a biologically active compound and a transport moiety.
                                                                                                                                                      The invention relates to identifying the structure of dimethylarginine. The method involves (i) obtaining a neutral loss spectrum of a peptide containing a dimethylarginine by mass spectroscopy and (ii) determining if the neutral loss spectrum shows one or both of neutral loss of monomethylamine (MMA), dimethylcarbodiimide (DMC) and/or neutral loss of dimethylamine (DMA). The neutral loss of MMA and DMC indicates the presence of a symmetrically dimethylated arginine residue and the neural loss of (DMA) indicates the presence of asymmetrically dimethylated arginine residue. Sequences ABB82931-939 represent synchetic peptides having symmetrically and asymmetrically dimethylated arginine residue sused used in an experiment to determine if mass spectrometry could be used distinguish the peptides that have symmetrically versus asymmetrically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transporter, Spaced arginine moiety, vasotropic, neuroleptic, analgesic, antiparkinsonian, biologically active compound, biological membrane, epithelial tissue, endothelial tissue, ischaemia, neurotransmitter;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /label= Acp

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to identifying the structure of dimethylarginine. The method involves (i) obtaining a neutral loss spectrum of a peptide containing a dimethylarginine by mass spectroscopy and (ii) determining if the neutral loss spectrum shows one or both of neutral loss of monomethylamine (MMA), dimethylamide (DMC) and/or neutral loss of dimethylamine (DMA). The neutral loss of MMA and DMC indicates the
                                                                                                               present invention describes a composition (C) comprising a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying structure of dimethyl arginine for proteomics business by obtaining neutral loss spectra of peptide containing dimethylarginine residues by mass spectrometry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to identifying the structure of dimethylarginine. The method involves (1) obtaining a neutral loss spectrum of a peptide containing a dimethylarginine by mass spectroscopy and (ii) determining if the neutral loss spectrum shows one or both of neutral loss of monomethylamine (MMA), dimethylcarbodiimide (DMC) and/or neutral loss of dimethylamine (DMA), The neutral loss of MMA and DMC indicates the presence of a symmetrically dimethylated arginine residue and the neural loss of (DMA) indicates the presence of asymmetrically dimethylated arginine residue. Sequences ABB82931-339 represent synthetic peptides having symmetrically and asymmetrically dimethylated arginine residues used in an experiment to determine if mass spectrometry could be used
presence of a symmetrically dimethylated arginine residue and the neural loss of (DMA) indicates the presence of asymmetrically dimethylated arginine residue. Sequences ABB82931-939 represent synthetic peptides having symmetrically and asymmetrically dimethylated arginine residues used in an experiment to determine if mass spectrometry could be used distinguish the peptides that have symmetrically versus asymmetrically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               used in an experiment to determine if mass spectrometry could be used distinguish the peptides that have symmetrically versus asymmetrically dimethylated arginine residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying structure of dimethyl arginine for proteomics business by obtaining neutral loss spectra of peptide containing dimethylarginine residues by mass spectrometry.
                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                      Dimethylarginine; mass spectroscopy; monomethylamine; dimethylamine; DMA; MMA; dimethylcarbodiimide; DMC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The method involves (1) obtaining a neutral loss spectrum of a peptide containing a dimethylarginine by mass spectroscopy and (11) determining if the neutral loss of neutral loss of momentylamine (MMA), dimethylamide (DMC) and/or neutral loss of dimethylamine (MMA), dimethylamide (DMC) and/or neutral loss of dimethylamine (DMA). The neutral loss of MMA and DMC indicates the presence of a symmetrically dimethylated arginine residue and the neural loss of (DMA) indicates the presence of asymmetrically dimethylated arginine residue. Sequences ABBR2931-939 represent synthetic peptides having symmetrically and asymmetrically dimethylated arginine residues the presence of asymmetrically dimethylated arginine residues distinguish the peptides that have symmetrically versus asymmetrically dimethylated arginine residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to identifying the structure of dimethylarginine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying structure of dimethyl arginine for proteomics business by obtaining neutral loss spectra of peptide containing dimethylarginine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

```
The invention relates to a peptide (S33), comprising symmetrical dimethylated arginine (sDWA), that is able to react with antibodies which are present in sera from patients with systemic lupus erythematosus (SLE). The peptide or a multimer peptide comprising (S33) is useful for the in vitro diagnosis of systemic lupus erythematosus, for differential diagnosis to distinguish between SLE patients and patients with mixed connective tissue disease, or for the in vitro monitoring of the disease activity of daDNA negative SLE patients. The present sequence represents the amino acid sequence of the S33 peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New peptides comprising symmetrical dimethylated arginine for diagnosing systemic lupus erythematosus (SLE) or for differentiating between SLE and mixed connective tissue diseases.
                                                                                                                                      S33; symmetrical dimethylated arginine; systemic lupus erythematosus;
mixed connective tissue disease.
                                                                                                                                                                                                                                                                                                                  /note= "Symmetrical dimethylated arginine"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a composition comprising a biologically active compound and a transport group. The transport group comprises a spaced compound and a transport group. The transport group comprises a spaced compound absed peptide of formula given in the specification. The spaced poly-Arginine based peptide acts as a cellular membrane transport of the membrane. The conjugate is also useful in therapeutic, prophylactic and diagnostic applications. The composition improves the transport of biologically active compounds across the biological membrane and into animal epithelial or endothelial tissues. The arginine residue of the conjugate provides an enhanced transport of drugs and are a part of the conjugate provides unitable spacing between arginine residues. The transport groups deliver an agent across the stratum conneum, which cransport groups deliver an agent across the stratum conneum, which cransport groups deliver an agent across the stratum conneum, which cransport groups deliver an agent across the stratum conneum, which cransport groups deliver an agent across the stratum conneum, which cransport groups deliver an antibacterials, antifungals, antiproliferatives, immunosuppressives, vitamins, analgesics and hormones. The present sequence is a Fluorescently labelled spaced carginine transport peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The sequences given in AAR25058-60 are examples of random copolymer peptides which can be used in diagnostic methods and systems relating to Epstein-Barr virus nuclear antigen (EBNA). These peptides are capable of inducing the production of antibodies which immunoreact with EBNA, and of immunoreacting with human antibodies induced by EBNA. The peptides can be fixed to a solid matrix, giving a solid immunoreactant in a diagnostic kit. The assay developed using these peptides has been found to be clinically reliable in detecting infectious mononucleosis (IM) caused by EBPCALLBARY VIRUS (EBV) as well as IM induced by cytomegalovirus, and also in detecting naspoharyngaal carcinoma, another disease in which EBV has been implicated. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a composition (I) comprising an amino acid sequence selected from $1 \text{ defined}$ amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of particularly when compared to the use of whole antigens in vaccines, particularly when compared to the use of whole antigens in vaccines antigens is directed largely toward variable regions of the antigen, antigens is directed largely toward variable regions of the antigen, antigens for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vaccine compositions comprising human immunodeficiency virus-1 (HIV-1)

ö
escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. APPIISOI to ABP25412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes human RNA polymerase III subunit 21.45 (I). Also described is a method for producing (I) using DNA recombination technology. (I) and the polymucleotide encoding it can be used for treating several diseases, such as embryonic development deformity, tumour, diabetes, menstrual disorder, peptic ulcer, arrhythmia, anaemia and epilepsy. The present sequence represents the N-terminal peptide of (I), which can be used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human RNA polymerase III subunit 21.45 N-terminal peptide SEQ ID NO:7.

```
The invention relates to a novel compound or its salt. The compound of the invention may be useful for measuring the activity of histone-deacetylase, screening for a histone-deacetylase inhibitor and identifying the subtypes of histone-deacetylase. The current sequence is that of the human E2F1-derived peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                           Novel peptide substrate or its salt, useful for measuring histone-deacetylase activity and screening of histone-deacetylase inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

This invention relates to a novel method for measuring the histone—deacetylase (HDAC) activity of a substrate using specific radioactivity, fluorescence or a colour developing substrate. Specifically, it refers to compound such as oppidyl-Lys(Ac)-MCA, which comprises a protecting group of a hydrogen atom or an amino terminus, a group in which deacetylation is carried out by the histone deacetylase linked to an acetylated lysine residue that in turn is linked to the fluorescent group MCA (7-amino 4-methylcoumarin). The present invention describes a method for measuring HDAC activity, as well as identifying the subtype of histone deacetylase. Furthermore, it can be used to screen for histone deacetylase inhibitors, such that they can be used to regulate gene expression. Accordingly, these compositions can be used to tregulate gene expression. Accordingly, these compositions can be used to tregulate and exhibit cytostatic activities. This peptide sequence is a C-terminal acetylated human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human; BFLF; erythroid Kruppel like factor; histone-deacetylase; HDAC; fluorescence; colour developing substrate; histone deacetylase inhibitor;
                                                                                                                                                                                             The invention relates to a novel compound or its salt. The compound of the invention may be useful for measuring the activity of histone-deacetylase, screening for a histone-deacetylase inhibitor and identifying the subtypes of histone-deacetylase. The current sequence is that of the human E2F1-derived peptide of the invention.
                                                                                             Novel peptide substrate or its salt, useful for measuring histone-deacetylase activity and screening of histone-deacetylase inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel peptide substrate or its salt, useful for measuring histone deacetylase activity.
                                                                                                                                                                                                                                                                                                                                                         100.0%; Score 27; DB 7; Length 15; 100.0%; Pred. Specifically, it refers to compound such as peptidyl-Lys AC) "MCA, which comprises a protecting group of a hydrogen atom or an amino terminus, a group in which deacetylation is carried out by the histone deacetylase linked to an acetylated lysine residue that in turn is linked to the fluorescent group MCA (7-amino 4-methylcoumarin). The present invention describes a method for measuring HDAC activity, as well as identifying the subtype of histone deacetylase. Furthermore, it can be used to screen for histone deacetylase inhibitors, such that they can be used to requiate gene expression. Accordingly, these compositions can be used to treat cancer and exhibit cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                      human, BFLF; erythroid Kruppel like factor; histone-deacetylase; HDAC; fluorescence; colour developing substrate; histone deacetylase inhibitor;

New peptides comprising symmetrical dimethylated arginine for diagnosing systemic lupus erythematosus (SLE) or for differentiating between SLE and mixed connective tissue diseases.
                                                                                                                                                                                                                                                                                                                               The invention relates to a peptide (S33), comprising symmetrical dimethylated arginine (sDWA), that is able to react with antibodies which are present in sera from patients with systemic lupus erythematosus (SLE). The peptide or a multimer peptide comprising (S33) is useful for the in vitro diagnosis of systemic lupus erythematosus, for differential diagnosis to distinguish between SLE patients and patients with mixed connective tissue disease, or for the in vitro monitoring of the disease activity of dsDWA negative SLE patients. The present sequence represents the amino acid sequence of a SmD3 C-terminal extension peptide mimotope.
                                                                                                                                                                                                             New peptides comprising symmetrical dimethylated arginine for diagnosing systemic lupus erythematosus (SLE) or for differentiating between SLE and mixed connective tissue diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          symmetrical dimethylated arginine, systemic lupus erythematosus; connective tissue disease; \mbox{SmD1}\,.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a peptide (S33), comprising symmetrical dimethylated arginine (SDMA), that is able to react with antibodies which are present in sera from patients with systemic lupus erythematosus (SLE). The peptide or a multimer peptide comprising (S33) is useful for the in vitro diagnosis of systemic lupus erythematosus, for differential diagnosis to distinguish between SLE patients and patients with mixed connective tissue disease, or for the in vitro monitoring of the disease activity of dsDNA negative SLE patients. The present sequence represents the amino acid sequence of a SmD3 C-terminal extension peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptides comprising symmetrical dimethylated arginine for diagnosing systemic lupus erythematosus (SLE) or for differentiating between SLE and mixed connective tissue diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        dimethylated arginine; systemic lupus erythematosus; tissue disease; SmD3.

The invention relates to a peptide (S33), comprising symmetrical dimethylated arginine (SDMA), that is able to react with antibodies which are present in sera from patients with systemic lupus erythematosus (SLE). The peptide or a multimer peptide comprising (S33) is useful for the in vitro diagnosis of systemic lupus erythematosus, for differential diagnosis to distinguish between SLE patients and patients with mixed connective tissue disease, or for the in vitro monitoring of the disease activity of dabba negative SLE patients. The present sequence represents the amino acid sequence of a SmDI C-terminal extension peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a peptide (S33), comprising symmetrical dimethylated arginine (SDMA), that is able to react with antibodies which are present in sera from parients with systemic lupus expthematosus (SLE). The peptide or a multimer peptide comprising (S33) is useful for the in vitro diagnosis of systemic lupus expthematosus, for differential diagnosis to distinguish between SLE patients and patients with mixed connective tissue disease, or for the in vitro monitoring of the disease activity of dsDMA negative SLE patients. The present sequence represents the amino acid sequence of a SmD1 C-terminal extension peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptides comprising symmetrical dimethylated arginine for diagnosing systemic lupus erythematosus (SLE) or for differentiating between SLE and mixed connective tissue diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S33; symmetrical dimethylated arginine, systemic lupus erythematosus,
mixed connective tissue disease; SmD1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 27; DB 8; Length 15; 100.0%; Pred. The invention relates to a peptide (S33), comprising symmetrical dimethylated arginine (BDMA), that is able to react with antibodies which are present in sera from patients with systemic lupus erythematosus (SLE). The peptide or a multimer peptide comprising (S33) is useful for the in vitro diagnosis of systemic lupus erythematosus, for differential diagnosis to distinguish between SLE patients and patients with mixed connective tissue disease, or for the in vitro monitoring of the disease activity of daDNA negative SLE patients. The present sequence represents the amino acid sequence of a SMD3 C-terminal extension peptide.
                                                                                                                                                                                                                                                                                                                                                                                                               l dimethylated arginine for diagnosing or for differentiating between SLE and

The invention relates to a peptide (833), comprising symmetrical dimethylated arginine (8DMA), that is able to react with antibodies which are present in sera from patients with systemic lupus erythematosus (SLE). The peptide or a multimer peptide comprising (833) is useful for the in vitro diagnosis of systemic lupus erythematosus, for differential diagnosis to distinguish between SLE patients and patients with mixed connective tissue disease, or for the in vitro monitoring of the disease activity of dabNA negative SLE patients. The present sequence represents the amino acid sequence of a SmD1 C-terminal extension peptide.
                                                                                                                                                                                                                           New peptides comprising symmetrical dimethylated arginine for diagnosing systemic lupus erythematosus (SLE) or for differentiating between SLE and mixed connective tissue diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptides comprising symmetrical dimethylated arginine for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            symmetrical dimethylated arginine; systemic lupus erythematosus; connective tissue disease; SmD3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 27; DB 8; L

The peptide or a multimer peptide comprising (833) is useful for the in vitro diagnosis of systemic lupus erythematosus, for differential diagnosis to distinguish between SLE patients and patients with mixed connective tissue disease, or for the in vitro monitoring of the disease activity of dsDNA negative SLE patients. The present sequence represents the amino acid sequence of a SmD3 C-terminal extension peptide.
                                                                                    The invention relates to a peptide (S33), comprising symmetrical dimethylated arginine (sDMA), that is able to react with antibodies which are present in sera from patients with systemic lupus erythematosus (SLE). The peptide or a multimer peptide comprising (S33) is useful for the in vitro diagnosis of systemic lupus erythematosus, for differential diagnosis to distinguish between SLE patients and patients with mixed connective tissue disease, or for the in vitro monitoring of the disease activity of dsDNA negative SLE patients. The present sequence represents the amino acid sequence of a SmD3 C-terminal extension peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New peptides comprising symmetrical dimethylated arginine for diagnosing systemic lupus erythematosus (SLE) or for differentiating between SLE and
systemic lupus erythematosus (SLE) or for differentiating between SLE and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a peptide (S33), comprising symmetrical dimethylated arginine (SDMA), that is able to react with antibodies which are present in sera from parients with systemic lupus extythematosus (SLE). The peptide or a multimer peptide comprising (S33) is useful for the in vitro diagnosis of systemic lupus erythematosus, for differential diagnosis to distinguish between SLE patients and patients with mixed connective tissue disease, or for the in vitro monitoring of the disease activity of dabNA negative SLE patients. The present sequence represents the amino acid sequence of a SmD1 C-terminal extension peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New peptides comprising symmetrical dimethylated arginine for diagnosing systemic lupus erythematosus (SLE) or for differentiating between SLE and

The invention relates to a peptide (S33), comprising symmetrical dimethylated arginine (sDWA), that is able to react with antibodies which are present in sera from patients with systemic lupus erythematosus (SLE). The peptide or a multimer peptide comprising (S33) is useful for the in vitro diagnosis of systemic lupus erythematosus, for differential diagnosis to distinguish between SLE patients and patients with mixed connective tissue disease, or for the in vitro monitoring of the disease activity of deDNA negative SLE patients. The present sequence represents the amino acid sequence of a SMDI C-terminal extension peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New peptides comprising symmetrical dimethylated arginine for diagnosing systemic lupus erythematosus (SLE) or for differentiating between SLE and
S33; symmetrical dimethylated arginine; systemic lupus erythematosus; mixed connective tissue disease; SmD1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             dimethylated arginine; systemic lupus erythematosus; tissue disease; SmD3.

New peptides comprising symmetrical dimethylated arginine for diagnosing systemic lupus erythematosus (SLE) or for differentiating between SLE and mixed connective tissue diseases.

XX

Disclosure; Fig 1b; 38pp; English.

XX

The invention relates to a peptide (S33), comprising symmetrical dimethylated arginine (SDMA), that is able to react with antibodies which are present in sera from patients with systemic lupus erythematosus (C (SLE). The peptide or a multimer peptide comprising (S33) is useful for the in vitro diagnosis of systemic lupus erythematosus, for differential diagnosis to distinguish between SLE patients and patients with mixed activity of dabNA negative SLE patients. The present sequence represents (C connective tissue disease, or for the in vitro monitoring of the disease activity of dabNA negative SLE patients. The present sequence represents XX

```
contraction that comprises administration of a peptide having more than 3 consecutive basic amino acid residues. Alternatively, the peptide contains the amino acid sequence Arg-Gly-Asp and a basic amino acid sequence, or the peptide comprises 6.0 and a contain at least 4 out of a sequence of 6 consecutive amino acids are basic amino acids. The method is used to allow normal tissue regeneration without excessive scar
                                                                                                                                                                                                                                                                                                                                                                                                                 Inhibition of wound contraction - with peptide derivatives rich in basic amino acids.
                                                                                                                              Wound contraction, reduction, inhibition, tissue regeneration, scar, wound; joint motion, body deformation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         provides methods for reduction or inhibition of wound
                                                                                                     Peptide used in a method for inhibiting wound contraction.

The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from S1 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of particularly when compared to the use of whole antigens in vaccine passed year of the use of whole antigens is directed largely toward variable regions of the antigen. Compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen. Callowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups, achieving, for example, enhanced composition of the groups, achieving, for example, enhanced composition of the target disease. Similar engineering of the response immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412

                                                                                                                         ద
                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      anditional advantage of an group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and HTL), and HTL, and BTL, and be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABPLISOI to ABPS5412 represent peptide sequences used in the exemplification of the present invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An
                                                                                                                                                                                                                                                                                                                                                     HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-detection domain and at least one effector domain. The pathogen-induced product detection domain in or pathogen-induced product of a pathogen or pathogen-induced product in the cell; the presence of a pathogen or pathogen and activate the effector domain. In the presence of a pathogen or pathogen and activate the effector domain. The pathogen or pathogen and activate the effector domain. The pathogen or pathogen and activate the effector domain. The pathogen or pathogen and activate the effector domain. The pathogen infection in an organism; (2) a chimeric molecule (I) having at least one pathogen-induced product-detection domain can dat least one effector domain; (3) an agent having at least one effector—mediating molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism. (1) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism.
                                                                                                   ö

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector comain. The pathogen-induced product to the pathogen-induced product comain. The pathogen-induced product in the cell, the presence of a pathogen or pathogen-induced product in the cell, the presence of a pathogen or pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen infection in an organism; (2) a chimeric molecule (1) having at least one pathogen-interacting or preventing the spread of a pathogen or pathogen-induced product-detection domain or pathogen-induced product-detection domain or pathogen-induced product-interacting molecular structure; and at least one effector-mediating molecular structure; and continuing an assay for detecting a pathogen infection in a cell or organism. (1) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. The present sequence is used in the exemplification of

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (1) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product chimeric molecules bind to the pathogen induced product in the cell, the presence of a pathogen or pathogen-induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen infection in an organism: (2) a chimeric molecule (1) having at least one pathogen-induced product-detection domain or pathogen-induced product-interacting molecular structure; and at least one effector mediating molecular structure; and at least one effector mediating molecular structure; and at least one effector mediating molecular structure; and at least one apathogen infection in a cell or organism.

(1) has antimicrobial activity, and can be used in gene therapy. The

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-induced product detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product in the cell chimeric of a pathogen or pathogen induced product in the cell, the presence of a pathogen or pathogen-induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen infection domain or pathogen-induced product-detection domain or pathogen-induced product-detection domain at least one effector domain, (3) an agent having at least one pathogen-induced product-detection domain at least one effector domain, (3) an agent having at least one structure and at least one pathogen-induced product-detection domain structure and at least one faffector-mediating molecular structure; and car least one effector on induced product-interacting and car least one effector and at least one effector and at least one effector and at least one effector of an an assay for detecting a pathogen infection in a cell or organism.

(4) an assay for detecting a pathogen infection in a cell or organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 method is useful for treating or preventing a pathogen infection in a cell or organism. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                         pathogen infection; chimeric molecule; pathogen-detection domain; pathogen-induced product-detection domain; effector domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Similarity 100.0%; Score 27; DB 7; Length 7; Similarity 100.0%; Pred. The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product detection domain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen-induced product in the cell, the presence of a pathogen or pathogen and activate the effector domain. Commeric molecules bind to the pathogen and activate the effector domain. The pathogen or preventing the spread of a pathogen or pathogen and activate the effector domain. Compathogen-detection domain or pathogen-induced product-detection domain. Compathogen-detection domain or pathogen-induced product-detection domain compathogen-induced product-interacting molecular structure; and at least one effector mediating molecular structure; and at least one effector. mediating molecular structure; and (1) has an assay for detecting a pathogen infection in a cell or organism. Compathod is useful for treating or preventing a pathogen infection in a cell or organism. The present sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (1) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product commain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen and activate the effector domain. Or pathogen induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. The pathogen infection in an organism; (2) a chimeric molecule (1) having at least one pathogen-induced product-detection domain or pathogen-induced product-detection domain or pathogen-induced product-detection domain or pathogen-induced product-interacting molecular structure and at least one effector domain; (3) an agent having at least one pathogen-induced product-interacting molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism.

(1) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. The present sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       100.0%; Score 27; DB 7; Length 7; 100.0%; Pred. The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product in the pathogen or pathogen-induced product in the containing the spread of a pathogen or pathogen induced product in the cell the containing the spread of a pathogen or pathogen and activate the effector domain. Containing the spread of a pathogen infection in an organism; (2) a chimeric molecule (1) having at least one pathogen-induced product-detection domain containing the spread of a pathogen containing the pathogen indection in a cell or organism. (1) has antimicrobial activity, and can be used in gene therapy. The containing or preventing a pathogen infection in a cell or organism. (1) has antimicrobial activity, and can be used in gene therapy. The containing or preventing a pathogen infection in a cell or organism.

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chineric molecules (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product detection domain is nor naturally bound to the effector domain. In the presence of a pathogen or pathogen-induced product in the cell, the presence of a pathogen or pathogen-induced product in the effector domain. In faction in an organism; (2) a chimeric molecule (1) having at least one infection in an organism; (3) a chimeric molecule (1) having at least one pathogen-induced product-detection domain or pathogen-induced product-detection domain or pathogen-induced product-detection domain at least one effector domain; (3) an agent having at least one effector—mediating molecular structure and at least one effector—mediating molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism. Cell has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. Cell or organism. The present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                               Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-induced product detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product in the cell containing to pathogen-induced product in the cell, the presence of a pathogen or pathogen induced product in the cell, the presence of a pathogen or pathogen and activate the effector domain. On the pathogen induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. On pathogen-detection domain. (2) a chimeric molecule (1) having at least one pathogen-induced product-detection domain or pathogen-induced product-detection domain contains and at least one effector domain, (3) an agent having at least one effector mediating molecular structure; and at least one effector—mediating molecular structure; and (1) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. The present sequence is used in the exemplification of

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product in the cell, the presence of a pathogen or pathogen-induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen infection in an organism; (2) a chimeric molecule (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain or pathogen-induced product-detection domain at least one effector domain; (3) an agent having at least one at least one effector—mediating molecular structure, and at least one effector—mediating molecular structure, and (4) an assay for detecting a pathogen infection in a cell or organism. It has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. The present invention.
                                                                                                                                                                                                                                                                                                              Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pathogen infection; chimeric molecule; pathogen-detection domain; pathogen-induced product-detection domain; effector domain; antimicrobial; gene therapy.

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (1) having at least one pathogen-detection domain cor pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product in the cell; the detection domain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen-induced product in the cell; the chimeric molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen or pathogen-induced product-detection domain. Companies; (2) a chimeric molecule (1) having at least one pathogen-induced product-detection domain companies; (3) an agent having at least one at least one effector domain; (3) an agent having at least one calcular structure and at least one effector—mediating molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism. The present invention in a pathogen infection in a cell or organism. The present invention is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                    Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain.

                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain cor pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product in the cell, the presence of a pathogen or pathogen-induced product in the cell, the presence of a pathogen or pathogen and activate the effector domain. In finearic molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen infection in an organism; (2) a chimeric molecule (I) having at least one pathogen-induced product-detection domain cor pathogen-induced product-detection domain at least one effector domain; (3) an agent having at least one can at least one effector—mediating molecular structure; and at least one effector—mediating molecular structure; and (1) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. The present invention.

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-induced product detection domain and at least one effector domain. The pathogen-detection domain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen and activate the effector domain. Commeric molecules bind to the pathogen and activate the effector domain. The chimeric molecules bind to the pathogen and activate the effector domain. The described. (1) treating or preventing the spread of a pathogen infection in an organism; (2) a chimeric molecule (1) having at least one pathogen-induced product-detection domain companies. Compathogen-interacting or pathogen-induced product-interacting molecular structure and at least one effector—mediating molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism. (1) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                        Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        pathogen infection, chimeric molecule, pathogen-detection domain, pathogen-induced product-detection domain, effector domain, antimicrobial; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell Chineric molecules (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product in the pathogen or pathogen-induced product in the cell, the presence of a pathogen or pathogen and activate the effector domain. In the presence of a pathogen or pathogen-induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen infection in an organism; (2) a chimeric molecule (1) having at least one pathogen-detection domain or pathogen-induced product-detection domain or pathogen-induced product-detection domain corputation and at least one effector domain; (3) an agent having at least one pathogen-induced product-detection domain corputation and at least one effector-mediating molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism. Call has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. The present invention or used in the exemplification of the present invention. Treating or preventing a pathogen infection in a cell by administering the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (1) having at least one pathogen-detection domain or pathogen-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product. Cetection domain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen-induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen infection in an organism; (2) a chimeric molecule (1) having at least one pathogen-induced product-detection domain and at least one effector domain; (3) an agent having at least one pathogen-induced product-detection domain at least one effector domain; (3) an agent having at least one structure and at least one effector-mediating molecular structure; and can be used in gene therapy. The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (1) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain and at least one effector domain. The pathogen-induced product commerced a pathogen or pathogen-induced product in the cell, the presence of a pathogen or pathogen and activate the effector domain. This described (1) treating or preventing the spread of a pathogen infection in an organism; (2) a chimeric molecule (1) having at least one pathogen-detection domain or pathogen-induced product-detection domain or pathogen-induced product-detection domain call at least one effector domain; (3) an agent having at least one pathogen-induced product-interacting molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism. (1) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. The present invention is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      pathogen infection; chimeric molecule; pathogen-detection domain; pathogen-induced product-detection domain; effector domain; antimicrobial; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

```
The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (1) having at least one pathogen-detection domain or pathogen-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product detection domain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen-induced product in the cell, the presence of a pathogen or pathogen and activate the effector domain. The pathogen or pathogen and activate the effector domain. The pathogen in an organism; (2) a chimeric molecule (1) having at least one pathogen-interacting or pathogen-induced product-detection domain or pathogen-induced product-detection domain or pathogen-induced product-interacting molecular structure and at least one effector—mediating molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism. (1) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. The present sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        t

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-detection domain and at least one effector domain. The pathogen detection domain or pathogen induced product in the effector domain. In the presence of a pathogen or pathogen-induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen infection in an organism; (2) a chimeric molecule (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain or pathogen-induced product-detection domain or pathogen-induced product-detection domain at least one effector domain; (3) an agent having at least one pathogen-induced product-detection domain corputable or pathogen-induced product-detection and at least one effector mediating molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism. (2) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. The present invention. Sequence 7 AA;

Inhibition of wound contraction - with peptide derivatives rich in basic amino acids.

Claim 11; Col 24; 16pp; English.

The invention provides methods for reduction or inhibition of wound concraction that comprises administration of a peptide having more than 3 consecutive basic amino acid residue. Alternatively, the peptide contains the amino acid sequence Arg-61y-Asp and a basic amino acid sequence. Arg-61y-Asp and a basic amino acid sequence, or the peptide comprises 6-30 amino acids in which at least 4 out of a sequence of 6 consecutive amino acids are basic amino acids. The method is used to allow normal tissue regeneration without excessive scar formation which, in the case of large wounds, can result in loss of joint

Chesnut Southwood S, Livingston BD, Kubo RT, Grey HM; Human immunodeficiency virus 1. 05-OCT-2000; 2000WO-US027766 05-OCT-1999; 99US-00412863 (EPIM-) EPIMMUNE INC. Sidney J, Celis E, WO200124810-A1 12-APR-2001, Sette A, Baker DM,

Vaccine compositions comprising human immunodeficiency virus-1 (HIV-1) peptide groups, useful for vaccinating against HIV-1.

WPI; 2001-354887/37

Claim 32; Page 359; 448pp; English.

the present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or unour-associated antigens, which therefore reduces that may be present in whole antigens can be avoided with the use of group based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as immunogenicity, Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABPI1501 to ABP25412 represent peptide sequences used in the exemplification of the present

cupon activation of (I), the optical properties of (III) are altered. The probe is useful for in vivo optical imaging of a target in a subject, by delivering the probe to the subject, allowing adequate time for activation of the probe within the target, illuminating the tracet with cativation of the probe within the target, illuminating the target with clight of a wavelength absorbable by the chromophores, detecting a signal cemitted by the chromophores, optionally, repeating the steps at a processor predetermined intervals to enable evaluation of the emitted signal of the chromophores in the subject over time, and forming an optical image from the emitted signal. The method is useful for detecting a disease e.g. inflammation (e.g. rheumatoid arthritis) cancer, cardiovascular disease (e.g. atherosolerosis), dermatological disease (e.g. diabetic retinopathy), infectious disease, immunological disease (e.g. diabetic retinopathy), infectious disease, inmunological disease (e.g. Alzheimer's disease and bone.

Collated disease (e.g. osteoporosis) in the subject, for characterising the severity of a disease in the subject and for characterising to phenotype or genotype of a disease in the subject and for characterising to the severity of a disease. The probe is also useful in in vivo imaging concerning the severity of a disease. The probe is also useful in a volve in an optical imaging of one or more different targets in a subject, by carrying out the above said method, administering the center agent to a subject, by carrying out the above said method, administering the composition (e.g. drug or a polypeptide expressed by a granish and images over time or at a different dose of a composition (e.g. drug or a polypeptide expressed by a cut using endoscope, catherer. The probe is useful for assessing the agent in a subject in a subject such as mannal e.g. human or animal cut a disease and in a subject such as mannal e.g. human or animal cut a disease, and in in vitro optical imaging method in a subject such a disease an

                                                                                                                                                                                                                                                                                  The invention relates to a novel activatable imaging probe comprising a chromophore attachment moiety and one or more chromophores which are chromophores that upon activation of the imaging probe the optical properties of the chromophores are altered. The imaging probe of the invention may be chromophores are altered. The imaging of a target in a subject or of two or more different targets simultaneously, as well as for detecting, assessing and monitoring treatment of a disease such as cancer, cardiovascular disease, interdegenerative disease, immunologic disease, autoimmune disease, intertious disease, intertious disease, and environmental disease. The current sequence is that of the cathepsin D specific substrate peptide (SEQ ID 7) of the invention.
                                                                                                                                                                                                  Novel activatable imaging probe for in vivo optical imaging of target, has chromophores linked to chromophore attachment moiety, so that upon activation of probe, optical properties of chromophores are altered.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present sequence is that of an oligopeptide which includes a chromophore activation site. It is a cathepsin B-specific substrate. The coligopeptide can be used as a spacer in chromophores of the invention.

The invention is directed to highly stable, water-soluble, asymmetric cyanine compounds and their use as chromophores. The new compounds include at least one reactive functional group that can be used for labelling, i.e. a chromophore attachment moiety. When multiple chromophores are attached to a single macromolecule, fluorescence quenching can be observed. The new biocompatible chromophores, and can no used for in vivo detection of specific protease activity, particularly for those proteases that play key roles in different aspects of cancer growth, metastasis formation, and angiogenesis. In addition to imaging, the new dyes can be used in a range of biotechnological applications,

The present invention relates to novel human Severe Acute Respiratory Syndrome (NSARS) viral nucleic acid and protein sequences derived from a hSARS) virus having China Center for Type Culture Collection Deposit Collection of the Correct Syndrome (NSARS) virus Present invention also relates to novel nucleic acid molecules (I; ADT41483 or ADT41485) encoding a nucleocapsid—(N) or spike (S)-gene protein of a hSARS virus. Also disclosed are methods for detecting the presence of a N- or S-gene of the hSARS virus or of the protein in a biological sample and identifying a subject infected with the hSARS virus. The hSARS virus, nucleic acid and protein sequences are useful as vaccines for disquosing or treating SARS. They are also useful in clinical and scientific research applications. The hSARS virus genome (ADT39027) was obtained and the amino acid sequences of all three reading frames were deduced. ADT39028 is the full-length protein encoded by the first reading frame and ADT39029-ADT39251 are the protein encoded by the first reading frame protein. ADT39252 is the full.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
              New nucleic acid molecule encoding nucleocapsid- or spike-gene protein of a human Severe Acute Respiratory Syndrome (hSARS) virus, useful for diagnosing and treating SARS.
                                                                                                                                                                                                                                                                                                                                                                                   length protein encoded by the second reading frame and ADT39253-ADT39748 are the peptides from the second reading frame protein. ADT39749 is the full-length protein encoded by the third reading frame and ADT39750-ADT40119 are the peptides from the third reading frame protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   virucide, vaccine, detection, severe acute respiratory syndrome, real-time quantitative polymerase chain reaction; SARS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Yuen K;
